New Daystar Rope Rollers Make Any Winch Roller Fairlead Compatible with Synthetic Rope

Phoenix, AZ – Daystar Products now offers a simple and economical way to upgrade a standard winch roller fairlead to work with any synthetic rope. Daystar's Rope Rollers replace the steel rollers on any conventional fairlead so you can retain the benefits of a roller fairlead while running synthetic winch rope.

Synthetic winch rope is rapidly becoming standard equipment on trail rigs because it offers several performance and safety advantages over conventional winch cable. However, there are unseen costs associated with converting a winch to use synthetic rope. The steel rollers on a conventional roller fairlead are not compatible to synthetic rope because they can cause chafing and abrasion. Most rope manufacturers recommend using an aluminum Hawse-type fairlead. These fairleads can cost over \$100, not to mention the extra time and hassle of installation. Further, some bumper designs are not compatible with a Hawse type fairlead.

Daystar's Rope Rollers are constructed of durable polyurethane material for superior chafing resistance. Polyurethane provides a smooth surface for the rope to slide against while being virtually unbreakable. Designed to withstand the tremendous forces that a modern winch can dish out, the Rope Rollers will not groove or gall during angled pulls. They work with any standard 5,000-9,000-lb. roller fairlead regardless of the manufacturer.

Combine Daystar's Rope Rollers with a Winch Isolator to complete your customized winch installation. For more information on these or other products, log on to www.daystarweb.com or call 800-595-7659.
